

Calcium CT Score

Your health is worth it.

A calcium CT Score is a convenient and non-invasive way of helping to determine if you may be at increased risk for a heart attack--and employing early intervention to keep your heart healthy. Exams typically take less than 5 minutes.

The screening is used to detect calcium deposits in the coronary arteries of your heart. A higher coronary calcium score suggests you have a higher chance of significant narrowing in the coronary arteries.

Many employers offer this exam at no cost to their employees, and—if outside of a plan—the fee is nominal. It is easy to schedule, and can help you take control of your life.

A physician order is necessary to have a Calcium CT Score. If you do not have one, Green Imaging can help you obtain one, with just a few interview questions.

Who should consider a Calcium Score Screening?

Ages 40 - 70

People with no symptoms, but are at risk for heart disease, including those with the following traits:

- Have a family history of heart disease
- Past or present smoker
- History of high cholesterol, diabetes or high blood pressure
- Overweight
- Inactive lifestyle

Younger than 40

People younger than 40 may consider a Calcium CT Score if high cholesterol (familial hypercholesterolemia) runs in your family.

Our patients give us an average 4.8 stars!
